### **AWS Labs**

### **Lab 09**

## **Dockerize a Node.js Application and Push to GitHub**

### **### Lab Objectives**

- Creating Dockerfiles for Node.js Applications
- Building and Running Docker Containers Locally
- Managing Application Dependencies in Docker
- Exposing Application Ports for Local Deployment
- Using Git and GitHub for Version Control
- Pushing Dockerized Projects to GitHub Repositories
- Verifying Containerized Application Deployment

---

🔗 Source Code Link:

[GitHub Repository](#)

☐ Branch Name: `nodejs-docker-task`

---

Task Title:

Dockerize Node.js Application and Push to GitHub

---

Objective:

Create a **Dockerized version** of the provided Node.js application and **deploy it locally** on your machine. Then, upload the project to your **personal GitHub repository** under a dedicated branch.

---

Requirements:

1. Dockerization

- Create a **Dockerfile** to containerize the Node.js app.
  - The image must:
    - Install dependencies using `npm install`
    - Expose the correct port used by the app (e.g., **3000**)
    - Run the application using `npm start` or the defined start command in **package.json**
- 

2. Local Deployment

- Run the container **locally** and verify that the application works correctly.
- 

3. GitHub Submission

- Create a **new branch** in your GitHub repository named **nodejs-docker-task**.
- Push the Dockerized project (including **Dockerfile** and all related files) to that branch.
- Example commit message:

*Added Dockerfile and container setup for Node.js app*

#### Deliverables:

- **GitHub repository link**
- **Branch name:** `nodejs-docker-task`
- **Screenshot** showing the running container on **localhost**

You are Welcome
